PROGRAMMING IN HASKELL

Chapter 7 - Higher-Order Functions

Introduction

A function is called <u>higher-order</u> if it takes a function as an argument or returns a function as a result.

twice ::
$$(a \rightarrow a) \rightarrow a \rightarrow a$$

twice f x = f (f x)

twice is higher-order because it takes a function as its first argument.

1

Why Are They Useful?

- z <u>Common programming idioms</u> can be encoded as functions within the language itself.
- z <u>Domain specific languages</u> can be defined as collections of higher-order functions.
- z <u>Algebraic properties</u> of higher-order functions can be used to reason about programs.

2

The Map Function

The higher-order library function called <u>map</u> applies a function to every element of a list.

$$map :: (a \rightarrow b) \rightarrow [a] \rightarrow [b]$$

For example:

2

The map function can be defined in a particularly simple manner using a list comprehension:

$$map f xs = [f x | x \leftarrow xs]$$

Alternatively, for the purposes of proofs, the map function can also be defined using recursion:

The Filter Function

The higher-order library function <u>filter</u> selects every element from a list that satisfies a predicate.

filter ::
$$(a \rightarrow Bool) \rightarrow [a] \rightarrow [a]$$

For example:

5

Filter can be defined using a list comprehension:

```
filter p xs = [x \mid x \leftarrow xs, p x]
```

Alternatively, it can be defined using recursion:

```
filter p [] = []
filter p (x:xs)
              = x : filter p xs
   | p x
   | otherwise = filter p xs
```

The Foldr Function

A number of functions on lists can be defined using the following simple pattern of recursion:

$$f[] = v$$

 $f(x:xs) = x \oplus f xs$

f maps the empty list to some value v, and any non-empty list to some function \oplus applied to its head and f of its tail.

For example:

The higher-order library function foldr (fold right) encapsulates this simple pattern of recursion, with the function \oplus and the value v as arguments.

For example:

```
sum = foldr (+) 0
product = foldr (*) 1
or = foldr (||) False
and = foldr (&&) True
```

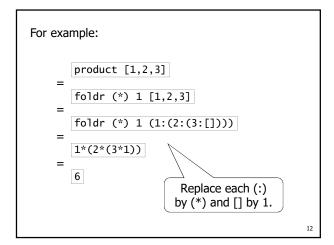

Foldr itself can be defined using recursion:

foldr::
$$(a \rightarrow b \rightarrow b) \rightarrow b \rightarrow [a] \rightarrow b$$

foldr f v [] = v
foldr f v (x:xs) = f x (foldr f v xs)

However, it is best to think of foldr non-recursively, as simultaneously replacing each (:) in a list by a given function, and [] by a given value.

For example:

Other Foldr Examples

Even though foldr encapsulates a simple pattern of recursion, it can be used to define many more functions than might first be expected.

Recall the length function:

```
length :: [a] \rightarrow Int
length [] = 0
length (_:xs) = 1 + length xs
```

13

```
For example: \begin{bmatrix} & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & &
```

Now recall the reverse function: $reverse [] = [] \\
reverse (x:xs) = reverse xs ++ [x]$ For example: $reverse [1,2,3] \\
= reverse (1:(2:(3:[]))) \\
= (([] ++ [3]) ++ [2]) ++ [1]$ = [3,2,1]

Why Is Foldr Useful?

- z Some recursive functions on lists, such as sum, are <u>simpler</u> to define using foldr.
- z Properties of functions defined using foldr can be proved using algebraic properties of foldr, such as <u>fusion</u> and the <u>banana split</u> rule.
- z Advanced program <u>optimisations</u> can be simpler if foldr is used in place of explicit recursion.

17

Other Library Functions

The library function (.) returns the <u>composition</u> of two functions as a single function.

(.) ::
$$(b \rightarrow c) \rightarrow (a \rightarrow b) \rightarrow (a \rightarrow c)$$

f. $g = \lambda x \rightarrow f (g x)$

For example:

```
odd :: Int \rightarrow Bool odd = not . even
```

The library function <u>all</u> decides if every element of a list satisfies a given predicate.

```
all :: (a \rightarrow Bool) \rightarrow [a] \rightarrow Bool
all p xs = and [p x | x \leftarrow xs]
```

For example:

```
> all even [2,4,6,8,10]
True
```

19

Dually, the library function <u>any</u> decides if at least one element of a list satisfies a predicate.

```
any :: (a \rightarrow Bool) \rightarrow [a] \rightarrow Bool
any p xs = or [p x \mid x \leftarrow xs]
```

For example:

```
> any (== ' ') "abc def"
True
```

The library function <u>takeWhile</u> selects elements from a list while a predicate holds of all the elements.

```
takeWhile :: (a \rightarrow Bool) \rightarrow [a] \rightarrow [a]
takeWhile p [] = []
takeWhile p (x:xs)
| p x = x : takeWhile p xs
| otherwise = []
```

For example:

```
> takeWhile (/= ' ') "abc def"
"abc"
```

21

Dually, the function <u>dropWhile</u> removes elements while a predicate holds of all the elements.

```
dropWhile :: (a \rightarrow Bool) \rightarrow [a] \rightarrow [a]
dropWhile p [] = []
dropWhile p (x:xs)
| p x = x : dropWhile p xs
| otherwise = xs
```

For example:

```
> dropWhile (== ' ') " abc"
"abc"
```

Exercises

- (1) What are higher-order functions that return functions as results better known as?
- (2) Express the comprehension [f x | x ← xs, p x] using the functions map and filter.
- (3) Redefine map f and filter p using foldr.

23
